

Having read through both flowcharts closely, here's my honest read.

The two diagrams aren't really describing different products — they're describing different stories about the same product. In both versions, the same ten-ish capabilities exist, and your own board betrays how interconnected they are: the AI Assistant calls Drafting and Translator as tools, Case Management feeds Legal Research, Document Scanner outputs get assigned to case files, OCR exists specifically to serve eFiling. Architecturally, you've built a platform. The question is purely how you want the world to enter it.

The platform framing is the stronger long-term story. "Lexli is the workspace for an advocate" (your own words on the board) is a clear, ownable position — it says the whole is worth more than the parts, it justifies a subscription rather than à-la-carte pricing, and it makes every new tool you ship feel like the platform getting more valuable rather than a new thing to market. Its weakness is acquisition: nobody searches Google for "legal workspace." They search "translate judgment to Marathi," "check case status by CNR," "cause list for tomorrow." A monolithic platform pitch asks a busy advocate to buy a whole new way of working before they've gotten any value from you. The products framing is the mirror image. Each tool becomes a doorway — its own landing page, its own search intent, its own "try it free in 30 seconds" moment. That's excellent for a starter-stage company that needs top-of-funnel. But as the primary identity, "a series of products" is a weaker position: it fragments a small team's marketing effort across ten product identities, it invites feature-by-feature comparison with point solutions (every OCR tool, every translation tool), and it undersells your actual advantage, which is that these tools share cases, files, and context. A bundle is easy to unbundle; a workspace isn't.

There's also a signal in your own homepage ideation that I think resolves this: the three doorways — Advocates, Law Firms & Businesses, Citizens. Advocates and firms want the platform story; they live in this world daily and the integrated workspace is the sell. Citizens will almost never want a platform — they want to check one case, translate one document. So your audiences themselves split across the two framings.

Which is why I'd land on: one brand, platform-first identity, products as entry points. Portray Lexli AI as the legal platform — that's the headline, the vision, the thing investors and firms buy. Then let the individual tools exist as named, individually discoverable features of the platform (with their own pages and possibly free standalone use for citizen-grade tasks like Case Finder or Translator), each funneling into the full workspace. That's essentially what your second diagram is reaching for, but I'd change one thing about it: don't present Platform and Products as siblings under Lexli AI, because that implies two separate businesses and will confuse pricing, navigation, and messaging. The products live inside the platform; some of them just have their own front doors.

Practically, that means the website says "Lexli — the AI platform for Indian legal practice" at the top, the nav has a Platform story page and a Tools dropdown, and each tool page ends in the same place: the platform. If it would help, I can sketch this as a third flowchart on the board — the hybrid IA — or map it into a concrete sitemap for the website. Also worth noting Figma has me on a View seat, so to draw into the board itself you'd need to bump that to an edit seat; otherwise I can deliver it as a diagram file here.

How the section reads, so you can walk your team through it: Lexli AI at the top is the only brand, with a single arrow down — "one brand, one product" — into the Lexli Platform hub. The left column (blue, dashed, matching your board's convention) is the platform core: accounts and profiles, AI Assistant, Advanced Search, Legal Research, and Case Management as the data spine. The right column (yellow) is the six tools — and this is the key structural change from your diagram 2: they hang off the Platform itself, not off a sibling "Products" node. Four of them (Daily Board, Legal Translator, Document Scanner, Case Finder) get an orange dashed "Public Front Door" badge — free standalone entry with its own landing page and search intent — with the dashed arrow pointing into the tool, showing doors funnel inward. At the bottom, the three green website doorways from Ayush's homepage ideation: Advocates and Law Firms & Businesses route to the platform story, Citizens route "free tools first" into the front doors. The white note captures the whole thesis in three lines.

You also have the same diagram as a persisted artifact in your Cowork sidebar (from earlier), which is handy for sharing outside Figma. Everything in the FigJam section is normal shapes and connectors, so feel free to drag things around — nothing is grouped weirdly.

Two things worth deciding next: which tools actually get front doors (I picked the four with obvious citizen-grade or high-search-intent use — Drafting and eFiling feel advocate-only, so they stay inside), and whether the free tier of each door is truly free or a teaser with limits. Happy to pressure-test either, or turn this IA into a concrete website sitemap with page-by-page content next.

Lexli — Hybrid IA (Option 3): one brand · platform-first · tools as front doors

Lexli - Hybrid IA (Option 3): One brand · Platform-first · Tools as front doors
